Hi FlutterFlow Team,

I'm applying for the Software Engineer role. Most of my recent work focuses on TypeScript, React, and Supabase, specifically building low-latency backend services and async pipelines.

A couple of projects relevant to what you're doing at FlutterFlow:

- **Gitlore** (Live): Built an async code architecture intelligence platform using TypeScript, Hono, and Cloudflare Workers to handle autonomous codebase mapping and AST diagram generation. Benchmarked at sub-second edge inference latency under multi-tenant requests.
- **Trellis** (GitHub): Engineered an asynchronous entity mapping architecture that traversed relational node hierarchies, handling high-density graph connection constraints.

Given FlutterFlow's focus on visual application builders and low-latency developer runtime engines, I can contribute immediately without needing to be trained on the fundamentals of TypeScript and reactive state architectures.
