Hi Intrepid Ventures Team,

I'm applying for the Back End Software Engineer role. Most of my recent work focuses on Rust/C++, Redis, and MySQL, specifically building low-latency backend services and async pipelines.

A couple of projects relevant to what you're doing at Intrepid Ventures:

- **Trellis** (GitHub): Built an async graph routing engine using Rust, Axum, and PostgreSQL to handle high-concurrency knowledge graph routing. Benchmarked at sub-50ms query latency under load.
- **AutoPBI** (GitHub): Engineered strict runtime data validation schemas and automated exception handling interfacing with Power BI REST APIs, handling zero-schema-discrepancy enterprise data constraints.

Given Intrepid Ventures's focus on high-frequency transactional backends and distributed systems performance, I can contribute immediately without needing to be trained on the fundamentals of low-latency backend systems and concurrent programming.
