Hi Leadex Systems Team,

I'm applying for the Java Developer role. Most of my recent work focuses on Java, Object-Oriented Design, and Relational Databases, specifically building low-latency backend services and async pipelines.

A couple of projects relevant to what you're doing at Leadex Systems:

- **Fasaar** (GitHub): Built an async networked server engine using Java, KryoNet, and MySQL to handle multiplayer state synchronization and network serialization. Benchmarked at 60 FPS tick rates under concurrent client connections.
- **AutoPBI** (GitHub): Engineered strict runtime data validation schemas and automated exception handling interfacing with Power BI REST APIs, handling zero-schema-discrepancy enterprise data constraints.

Given Leadex Systems's focus on enterprise system integration and robust backend data services, I can contribute immediately without needing to be trained on the fundamentals of Java, relational data design, and clean architecture.
