Hi Lemon.io Team,

I'm applying for the Java & React Developer role. Most of my recent work focuses on Java, React, TypeScript, and PostgreSQL, specifically building low-latency backend services and async pipelines.

A couple of projects relevant to what you're doing at Lemon.io:

- **Fasaar** (GitHub): Built an async networked server engine using Java, KryoNet, and MySQL to handle multiplayer state synchronization and network serialization. Benchmarked at 60 FPS tick rates under concurrent client connections.
- **Gitlore** (Live): Engineered edge-native AST parsing workers that analyzed complex repositories into visual architecture models, handling zero-cold-start runtime constraints.

Given Lemon.io's focus on resilient enterprise backend services and modern reactive frontends, I can contribute immediately without needing to be trained on the fundamentals of Java, React, and full-stack systems.
